

Release pipeline run

The release pipeline takes the output of the build pipeline and deploys it. It's basically the same as a normal pipeline run except for not building a container, hence there is not much to document on this page.

In the workflow drawing it would look like this. Please refer to [Normal pipeline run - MAAS Team Space - Confluence \(atlassian.net\)](#) for the normal pipeline run and explain in detail on how a normal run looks like

Release pipeline

Please refer to [Pipeline workflows - MAAS Team Space - Confluence \(atlassian.net\)](#) for input parameters and how to run the release pipeline.
